

Database Diagram of E-Commerce Website(ER Diagram)

Main Tables of the Laravel E-Commerce Website

1. Users Table

The "users" table stores information about all registered users of the website, including customers and administrators. It contains details such as name, email, password, and user role. The admin page uses this table to identify administrators.

2. Products Table

The "products" table stores all products available in the online store. It includes the product name, description, price, stock quantity, and image. The Home and Products pages display information from this table.

3. Cart_Items Table

The "cart_items" table keeps track of products added to a user's shopping cart. It stores the user ID, product ID, and quantity, allowing customers to review their selected items before checkout.

4. Orders Table

The "orders" table records completed purchases made by customers. It contains information such as the customer who placed the order, the total amount, and the order status. The Checkout page creates entries in this table.

5. Order_Items Table

The "order_items" table stores the individual products included in each order. It links products with orders and records the quantity and price of every item purchased.

6. Contacts Table

The "contacts" table stores messages submitted through the Contact page. It contains the sender's name, email address, and message, enabling communication between customers and the website administrators.

Relationship Between Tables

The tables work together to support the complete functionality of the e-commerce website. Users browse products, add them to the cart, place orders through the checkout process, and communicate through the contact page. Administrators manage products and monitor customer orders using the admin panel.
